

Photochromic Can

Celebrate the sun

Photochromic ink changes color as soon as the can is taken outside and exposed to natural sunlight.

Why use this effect?

- The colors come to life when outside.
- Packaging can reveal messages when exposed to the sun.
- Great for communicating outdoor living and healthy lifestyle values.
- Ideal for differentiated and interactive consumer experience at festivals and similar occasions.

Important things to know

- Photochromic describes the reaction of this ink when exposed to sunlight. Indoors the ink is protected from UV rays by the window glass and appears almost as a pearlescent white color. When taken outdoors, the ink reacts with UV rays and by magic it shows up in different colors.
- Photochromic ink is worth considering for brands consumed mainly outdoors, in parks, at festivals or outdoor sporting events.
- Photochromic inks are available in a limited number of colors. Pearlescent white to color available. It is not possible to match an exact Pantone color.*
- The photochromic effect is available on all can sizes.
- Elements created using photochromic ink should be placed in the main body of the can.
- We recommend design ideas are submitted to ensure the final artwork is feasible.*
- Compatible with cold-fill and pasteurization processes up to 82°C but not for retort.

Don't forget

- Lead Time: 6 weeks from artwork approval
- Minimum Order Quantity: 1 million units
- Inks do not react when indoors next to a closed window or under supermarket lighting (D65 / TL85 bulbs)
