

Thermochromic Can

Communicating chilled refreshment

Thermochromic ink changes color as soon as the ideal drinking temperature is reached.

Why use this effect?

- Packaging can reveal messages when the can is cold enough.
- Color change indicates that the drink is perfectly chilled.
- Creating interactive opportunities for consumers.
- Great for improving user experience.

Important things to know

- Thermochromic ink is a printing ink which changes color when the can gets cold. It provides a visual temperature indicator to indicate when the product inside the can is chilled to a designated temperature.
- Thermochromic inks are available in a limited number of colors. White to color or color to color are available. It is not possible to match an exact Pantone color.*
- Ink performance begins to deteriorate when exposed in direct sun for 6 hours.
- The thermochromic effect is available on all can sizes.
- Elements created using thermochromic ink should be placed in the main body of the can.
- We recommend design ideas are submitted to ensure the final artwork is feasible.*
- Compatible with cold-fill and pasteurization processes up to 82°C but not for retort.

Don't forget

- Lead Time: 6 weeks from artwork approval
- Minimum Order Quantity: 1 million units
